Response to Arguments

1. Applicant's arguments with respect to claims 1-17 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Lee in view of Bannai et al.

Art Unit: 2667

Regarding claim 1, Lee discloses (Abstract, col. 2, line 20-65) processing priority data as associated with in an ATM network (integrated network switch), ATM switches and prioritizes data (data frames). Lee is silent on user-defined policy of data frames.

Bannai discloses (Abstract, col. 6, line 1-67, col. 8, line 15 thru col. 13, line 67) a processing packets in a packet-based network that includes network packet switches, prioritized data and prioritized switching per packet with respect to user-defined micro code. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to be motivated to include user-defined micro code in a packet-based switching system as associated with prioritizing routing of data for the purpose of minimizing or eliminating congestion in a network switch.

1. Claims 12-17 are allowed over prior art.
2. Claims 2-11 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
3. Although the combined cited art teach an integrated switching system that includes switching packets/resources between devices and switching policies, they fail to teach/suggest a plurality switch ports wherein each switch port includes a port filter configured for determining a presence of a user-selected attribute in a received layer 2 data frame and outputting a signal indicating the determined presence of the user-selected attribute within the data frame by one of the network switch ports having

received frame, a switching module configured for identifying a presence of an output port for each data frame based on at least one of a MAC source address and MAC destination address, and notifying by the one network switch port the detected presence of the user-selected attribute to the switching module/ is absent from the art. Claims 9 and 10 depend on claim 8, therefore, claims 9 and 10 are objected to as well.
